Sales Performance & Customer Insights Report

Data Analysis, Findings & Business Recommendations

Prepared for: ExpressMart Management

Prepared by: Jessica Doe Akpabli

Date: August 2026

TABLE OF CONTENTS

1. Introduction	3
2. Sales Timing & Peak Period Analysis	4
3. Product Performance Analysis	6
4. Regional Sales Performance	9
5. Customer Purchasing Behaviour	11
6. Sales Trends & Seasonality	8
7. Conclusion	15

1. Introduction

This report presents an analysis of ExpressMart's sales transaction data undertaken to support management's efforts to improve sales performance, customer experience, and operational efficiency. The analysis was designed to provide management with a clearer understanding of purchasing patterns, sales performance across different products and locations, and changes in demand over time.

The analysis focuses on five key areas: sales timing and peak periods, product performance, regional sales performance, customer purchasing behaviour, and sales trends and seasonality. Together, these areas provide a comprehensive view of the factors influencing ExpressMart's sales performance and highlight areas where management can take targeted action.

Beyond measuring historical performance, the analysis seeks to translate the observed patterns into practical business actions. The findings are used to identify opportunities to improve resource allocation, strengthen inventory and staffing decisions, support targeted marketing activities, and address periods or areas of weaker performance.

The report is accompanied by an interactive **Sales Performance Dashboard developed in Microsoft Excel**, which provides a visual view of key performance indicators, sales patterns, and other relevant metrics. The dashboard is intended to complement the findings presented in this report and provide management with an accessible tool for exploring the data and supporting data-driven decision-making.

2. Sales Timing & Peak Period Analysis

Sales performance was analysed across hourly periods, AM/PM periods, and months to identify the strongest points of customer activity. This analysis helps us understand when customers make purchases and identify the periods of highest demand, providing useful insights for planning staffing, inventory, and other operational resources.

2.1 Sales by Hour

Sales performance shows clear variation across the hours of the day. **Hour 19 (7:00 PM) recorded the highest hourly sales at US\$2,412,938.54**, followed by **Hour 12 (12:00 PM)** at US\$2,316,821.34 and **Hour 11 (11:00 AM)** at US\$2,300,610.24.

This pattern indicates that sales activity is particularly strong from the late morning through the evening, with the highest individual sales concentration occurring at **Hour 19 (7:00 PM)**. In contrast, sales were considerably lower during the early morning hours, with **Hour 3 (3:00 AM)** recording the lowest hourly sales at US\$145,757.89.

2.2 Sales by Time of Day (AM/PM)

Sales performance was also analysed by time of day to determine whether customer purchasing activity was stronger during the AM or PM period. **PM recorded total sales of US\$24,274,253.98**, compared with **US\$10,217,781.99 during the AM period**. This shows that the PM period generated substantially higher sales than the AM period.

The difference between the two periods indicates that customer purchasing activity is more concentrated in the **afternoon and evening**. This is consistent with the hourly analysis, where several of the highest-performing hours fall within the PM period, including **Hour 19 (7:00 PM)**, which recorded the highest individual hourly sales.

2.3 Sales by Month

Sales performance was further analysed across the months of the year to identify the periods with the highest overall sales. **December recorded the highest monthly sales at US\$4,613,443.34**, followed by **October at US\$3,736,726.88** and **April at US\$3,390,670.24**.

The results indicate that sales performance varies across the year, with **December** representing the strongest monthly sales period. October and April also recorded relatively high sales compared with the remaining months.

2.4 Recommendations

Based on the identified peak periods, ExpressMart should increase staffing levels during the afternoon and evening, particularly around Hour 19 (7:00 PM), which recorded the highest hourly sales. Inventory should also be replenished ahead of these high-demand periods to reduce the risk of stockouts and ensure that sufficient products are available when customer activity increases.

Additional preparation should be made for December, which recorded the highest monthly sales. Management should use this historical pattern to plan inventory purchases, staffing

levels, and promotional activities ahead of the expected increase in demand. These measures can help ExpressMart maintain efficient operations while taking advantage of its strongest sales periods.

3. Product Performance Analysis

This analysis examines product-level sales performance to identify the products generating the highest and lowest sales. It further evaluates selected factors associated with the performance of the leading products and provides recommendations for improving the performance of underperforming products.

3.1 Best-Performing Products

The product-level sales analysis identified the three products generating the highest total sales during the period under review. The results are presented below:

Product	Total Sales (US\$)
MacBook Pro Laptop	8,037,600.00
iPhone	4,794,300.00
ThinkPad Laptop	4,129,958.70

MacBook Pro Laptop emerged as the strongest-performing product, generating total sales of **US\$8.04 million**, substantially ahead of the iPhone and ThinkPad Laptop. The iPhone ranked second with approximately **US\$4.75 million**, while the ThinkPad Laptop generated approximately **US\$4.13 million**. Together, these three products represent the leading contributors to product-level sales and therefore form the focus of the subsequent analysis of factors associated with strong product performance.

The results indicate a clear concentration of sales among a small number of high-performing products, with the MacBook Pro demonstrating particularly strong revenue performance. The subsequent analysis examines **quantity ordered, unit price, geographic performance, and monthly sales patterns** to assess the factors associated with this performance.

3.2 Factors Associated with Strong Product Performance

3.2.1 Price

The analysis indicates that unit price is an important contributor to the sales value of the leading products. The MacBook Pro Laptop recorded the highest unit price at **US\$1,700**, followed by the ThinkPad Laptop at **US\$999.99** and the iPhone at **US\$700**. The higher unit price of the MacBook Pro Laptop helps explain how it generated the highest total sales despite not having the highest quantity ordered.

3.2.2 Location

Geographic analysis indicates that San Francisco is a particularly strong market for the three leading products. MacBook Pro Laptop, iPhone, and ThinkPad Laptop each recorded their highest city-level sales in San Francisco. The results also show strong sales for these products in other major markets, including Los Angeles and New York City. The table below presents the sales generated by the three leading products across selected high-performing cities.

City	MacBook Pro Laptop	iPhone	ThinkPad Laptop
San Francisco	US\$ 1,931,200.00	US\$ 1,162,700.00	US\$ 962,990.37
Los Angeles	US\$ 1,276,700.00	US\$ 782,600.00	US\$ 640,993.59
New York City	US\$ 1,116,900.00	US\$ 616,700.00	US\$ 559,994.40

The results reinforce the importance of these markets to the performance of the leading products. San Francisco recorded the highest city-level sales for all three products, while Los Angeles and New York City also contributed substantially to their overall sales. This geographic concentration suggests that demand in key markets is associated with the strong performance of the leading products.

3.2.3 Monthly Performance

The monthly analysis of the three leading products shows a clear concentration of their strongest sales in **December**. MacBook Pro Laptop recorded its highest monthly sales in December, followed by another strong performance in October. The iPhone also recorded its highest monthly sales in December, while the ThinkPad Laptop similarly recorded its highest monthly sales in December.

Notably, the results show that **December was the strongest month for all three of the leading products**. This finding is consistent with the monthly peak-sales analysis presented in **Section 2.3**, which identified December as the company's overall peak sales month. The consistency between the overall monthly analysis and the product-level analysis suggests that the strong performance of these leading products aligns with the company's broader seasonal sales pattern.

3.2.4 Overall Findings on Product Performance

Overall, the analysis indicates that the strong performance of the leading products is associated with a combination of unit price, geographic demand, and seasonal purchasing patterns. The MacBook Pro's higher unit price contributes to its strong sales value, while San Francisco emerged as the strongest market for all three leading products. In addition, December recorded the highest sales for MacBook Pro, iPhone, and ThinkPad Laptop, consistent with the overall peak-month finding identified in **Section 2.3**. These findings provide useful insights for inventory planning, sales forecasting, and targeted marketing activities.

3.3 Underperforming Products

The analysis reveals a distinction between low sales value and low product demand. Although AAA Batteries (4-pack) and AA Batteries (4-pack) recorded relatively low total sales, this is largely attributable to their low unit prices of US\$2.99 and US\$3.84, respectively. Despite their low sales value, both products recorded relatively high quantities ordered, indicating

strong customer demand. In contrast, the LG Dryer and LG Washing Machine recorded the lowest quantities ordered, at 646 and 666 units respectively, despite each having a relatively high unit price of US\$600, which is the fourth-highest unit price among the products analysed. This indicates that, despite their relatively high prices, the LG Dryer and LG Washing Machine are not attracting as much demand as the other products. The company could therefore focus more of its marketing efforts on these two products to encourage higher customer demand and improve their sales performance. Increasing demand for the LG Dryer and LG Washing Machine could therefore generate a more meaningful increase in sales than focusing on products that already demonstrate strong customer demand.

4. Regional Sales Performance

This analysis examines sales performance across different cities to identify variations in regional performance and highlight markets with potential for growth. Total sales and quantity ordered were compared across the cities to provide a clearer understanding of both sales value and customer purchasing activity. The findings are used to identify areas where targeted marketing and promotional activities could help improve regional performance.

4.1 Sales Performance by City

Sales performance varied considerably across the nine cities analysed. San Francisco recorded the highest total sales of US\$8,262,203.91, followed by Los Angeles with US\$5,452,570.80 and New York City with US\$4,664,317.43. Boston ranked fourth with US\$3,661,642.01, while Austin recorded the lowest total sales at US\$1,819,581.75. The table below presents the total sales and quantity ordered for each city, providing a comparison of both sales value and purchasing activity across the markets.

City	Quantity Ordered	Total Sales (US\$)
San Francisco	50,239	8,262,203.91
Los Angeles	33,289	5,452,570.80
New York City	27,932	4,664,317.43
Boston	22,528	3,661,642.01
Atlanta	16,602	2,795,498.58
Dallas	16,730	2,767,975.40
Seattle	16,553	2,747,755.48
Portland	14,053	2,320,490.61
Austin	11,153	1,819,581.75

The results show that the ranking of cities by total sales closely follows the ranking by quantity ordered. **San Francisco** leads on both measures, with **50,239** units ordered and more than **US\$8.2 million** in sales. At the other end of the ranking, **Austin** recorded both the lowest quantity ordered and the lowest total sales. This indicates that differences in purchasing volume are an important factor in the variation in sales performance across the cities.

4.2 Cities with Potential for Growth

From the analysis, **Austin** recorded the lowest total sales of **US\$1,819,581.75** and also had the lowest quantity ordered, with **11,153** units. This shows that customer purchasing activity in Austin is lower compared with the other cities. Since the city recorded both the lowest

sales and the lowest quantity ordered, Austin could be an area where the company can focus more attention to increase customer demand and improve sales.

4.3 Recommendation

ExpressMart should focus more of its marketing efforts on Austin to increase customer awareness and encourage higher purchasing activity in the city. The company could use targeted promotions, locally focused advertising, and increased visibility of selected products to attract more customers and encourage them to make purchases. Promotional activities could also be timed around periods of higher customer activity to improve their effectiveness. Since Austin recorded both the lowest quantity ordered and the lowest total sales among the cities analysed, increasing the number of purchases in the city could have a direct impact on its overall sales performance. The company should also monitor the response to these marketing activities to determine which strategies are most effective in increasing customer demand and sales in the market.

5.0 Customer Purchasing Behaviour Analysis

This analysis examines customer purchasing behaviour by looking at the products customers purchase, the locations where purchasing activity is highest, the time of day when customers are more active, and the relationship between product prices and quantity ordered. The analysis helps identify customer preferences and demographic patterns across different markets. These findings provide a better understanding of what customers are more likely to purchase and where demand is strongest, which can help ExpressMart tailor its marketing efforts and product offerings to better meet customer demand.

5.1 Product Preference

Product	Quantity Ordered
AAA Batteries (4-pack)	31,017
AA Batteries (4-pack)	27,635
USB-C Charging Cable	23,975
Lightning Charging Cable	23,217
Wired Headphones	20,557
Apple Airpods Headphones	15,661
Bose SoundSport Headphones	13,457
27in FHD Monitor	7,550
iPhone	6,849
27in 4K Gaming Monitor	6,244
34in Ultrawide Monitor	6,199
Google Phone	5,532
Flatscreen TV	4,819
Macbook Pro Laptop	4,728
ThinkPad Laptop	4,130
20in Monitor	4,129
Vareebadd Phone	2,068
LG Washing Machine	666
LG Dryer	646

The analysis shows that **AAA Batteries (4-pack)** were the most purchased product, followed by **AA Batteries (4-pack)** and **USB-C Charging Cable**. This indicates strong customer demand for these products based on the quantity ordered. The finding also shows that high customer demand does not necessarily translate into the highest sales value, as previously observed in the analysis of underperforming products in **Section 3.3**.

5.2 Geographic Purchasing Pattern

The regional analysis presented in **Section 4.1** also provides insight into customer purchasing activity across locations. **San Francisco** recorded the highest quantity ordered, followed by **Los Angeles** and **New York City**, indicating stronger purchasing activity in these markets. These locations may therefore provide useful markets for targeted marketing and product availability.

5.3 Purchasing Behaviour by Time of Day

The analysis of sales by time of day in **Sections 2.1** and **2.2** also provides insight into customer purchasing behaviour. The results show higher purchasing activity during the **afternoon** and **evening** periods, suggesting that customers are more active during these times. This pattern can be considered when planning marketing activities and ensuring product availability during periods of higher customer activity.

5.4 Customer Demographics, Preferences and Marketing Implications

The findings from the earlier analyses provide useful insights into customer preferences and purchasing patterns across different locations. In terms of product preference, AAA Batteries (4-pack), AA Batteries (4-pack), and USB-C Charging Cable recorded the highest quantities ordered, indicating strong customer demand for these products. In contrast, the LG Dryer and LG Washing Machine recorded the lowest quantities ordered despite their relatively high unit prices, indicating comparatively lower customer demand. As recommended in **Section 3.3**, these products could therefore receive more targeted marketing attention to encourage higher customer demand and improve their sales performance.

From a geographic perspective, the regional analysis in **Section 4.1** shows that San Francisco recorded the highest purchasing activity, followed by Los Angeles and New York City, while Austin, Portland, and Seattle recorded comparatively lower levels of purchasing activity. As recommended in **Section 4.3**, these lower-performing locations could therefore receive more targeted marketing attention through locally focused promotions and advertising to encourage higher customer demand and improve sales. This approach could help increase demand for underperforming products, improve sales in weaker markets, and ensure that frequently purchased products remain readily available across both high- and lower-performing locations.

6. Sales Trend and Seasonality

This section examines the company's sales performance over time to identify changes in sales activity across different months and quarters. The analysis focuses on the monthly and quarterly sales trends to determine periods of relatively high and low sales performance and to identify any recurring patterns in customer purchasing activity. The findings will also be used to identify traditionally low-performing periods and propose appropriate strategies that the company can use to improve sales during those periods.

6.1 Monthly Sales Trend

The monthly sales trend was analysed to understand how sales performance changed throughout the year. The analysis considered total sales recorded in each month from January to December, allowing periods of stronger and weaker sales activity to be identified. The chart below shows the trend of sales over the year.

The chart shows that sales increased steadily from **US\$1,822,256.73 in January** to **US\$3,390,670.24 in April**, which shows a strong improvement in sales during the first part of the year. Sales then declined in May and June, recording **US\$3,152,606.75** and **US\$2,577,802.26**, respectively. Sales increased slightly again in July to **US\$2,647,775.76**, before declining through August and September, which recorded **US\$2,244,467.88** and **US\$2,097,560.13**, respectively.

Sales performance improved again in October, reaching **US\$3,736,726.88**, followed by **US\$3,199,603.20 in November**. **December** recorded the highest monthly sales of **US\$4,613,443.34**, making it the strongest-performing month during the period under review. January recorded the lowest monthly sales at **US\$1,822,256.73**.

Overall, the monthly trend shows clear variations in sales performance throughout the year. Sales were relatively lower at the beginning of the year, increased significantly towards April, declined during the middle of the year, and increased again towards the final quarter. The strong performance recorded in October and December, particularly the peak in December, suggests that customer purchasing activity was higher towards the end of the year. These

monthly patterns will be further examined alongside the quarterly sales results to determine the periods that may require additional strategies to improve sales.

6.2 Quarterly Sales Trend

The quarterly sales trend was analysed to further assess the company's sales performance across the four quarters of the year. The analysis shows that sales varied across the quarters, with the second and fourth quarters recording stronger performance compared to the first and third quarters.

The first quarter recorded total sales of **US\$6,831,379.53**, while sales increased to **US\$9,121,079.25** in the second quarter. Sales then declined slightly in the third quarter to **US\$6,989,803.77**, before rising significantly in the fourth quarter to **US\$11,549,773.42**, which was the highest quarterly sales recorded during the period under review.

Overall, the quarterly trend shows that the **fourth quarter was the strongest-performing quarter**, while the **first quarter recorded the lowest total sales**. The increase in sales during the fourth quarter is consistent with the strong performance observed in the monthly analysis, particularly the high sales recorded in October and December. This suggests that customer purchasing activity was generally stronger towards the end of the year.

6.3 Strategies for Low-Performing Periods

Based on the monthly and quarterly sales analysis, the company could focus its marketing efforts on the first and third quarters, which recorded relatively lower sales compared with the stronger second and fourth quarters. Targeted promotional campaigns, increased advertising, and improved product visibility during these periods could help encourage more customer purchases. The company could also use frequently purchased products in these campaigns to attract customers and create awareness of other products with lower demand. These strategies could help increase customer activity during weaker sales periods and improve overall sales performance throughout the year.

6. Conclusion

The analysis of the company's sales data provides a clear picture of sales performance across products, months, quarters, cities, periods of the day, and ordering hours. During the period under review, the company recorded total sales of **\$34,492,035.97**, with **209,079 units** sold across **19 products**. The results show considerable variation in sales performance throughout the year, with stronger performance towards the end of the year. The fourth quarter recorded the highest quarterly sales of **\$11,549,773.42**, while the first quarter recorded the lowest at **\$6,831,379.53**. At the monthly level, December was the strongest-performing month, generating **\$4,613,444.34**, while January recorded the lowest sales of **\$1,822,256.73**.

The analysis also revealed differences in sales performance across products and cities. The **MacBook Pro Laptop** recorded the highest sales among the products analysed, while **San Francisco** recorded the highest sales among the cities. Sales were also substantially higher during the **PM period**, which accounted for **70.38%** of sales, compared with **29.62%** during the AM period. The hourly quantity analysis further identified variations in ordering activity throughout the day, providing useful information for operational and inventory planning.

Based on these findings, the company should use the identified sales patterns to improve performance during traditionally low-performing periods. Management should plan targeted marketing and customer-engagement activities ahead of weaker months, particularly during periods when sales historically decline. These activities should be informed by customer purchasing patterns, high-performing products, and location-specific demand. The company should also align inventory, staffing, and operational capacity with periods of higher purchasing activity, particularly during the PM period and identified peak ordering hours.

Regular monitoring of product, city, monthly, quarterly, and time-based performance is also recommended to help management identify emerging changes in demand and respond promptly. Strong-performing products and locations can provide useful insights for future sales planning, while weaker areas can be examined to identify opportunities for improvement.

Overall, the findings demonstrate that sales performance varies according to **seasonality, product demand, location, period of day, and ordering patterns**. Using these insights to guide sales, marketing, inventory, and operational decisions can help the company improve performance more consistently throughout the year. The accompanying **interactive sales performance dashboard** supports the findings presented in this report by allowing users to explore key sales indicators and patterns through filters for month, city, year, quarter, and period of day. Together, the report and dashboard provide a practical basis for monitoring performance and supporting data-driven decision-making.
